ABSTRACT

Write in the last.

1. INTRODUCTION

Video streaming has become one of the most popular on-line activities, which creates an enormous market with various content providers (CPs). Video streaming services for movies and TV shows (Netflix, Hulu, Amazon

2. RELATED WORK

Video Access Behavior. These works usually focus on one single system, and their analysis is also limited to a specific context. In contrast, our work collects a dataset of video viewing behaviors across six major video providers with contexts such as VoD, IPTV, live streaming. This allows us to understand user migratory patterns across content providers. [3] analyze the influence of video stream quality on user behavior from multiple CPs using quasi-experimental designs, but they do not have an in-depth study of characterizing migration behaviors. [2][1]

3. METROPOLIS-HASTINGS ALGORITHM

Video Access Behavior. These works usually focus on one single system, and their analysis is also limited to a specific context. In contrast, our work collects a dataset of video viewing behaviors across six major video providers with contexts such as VoD, IPTV, live streaming. This allows us to understand user migratory patterns across content providers. [3] analyze the influence of video stream quality on user behavior from multiple CPs using quasi-experimental designs, but they do not have an in-depth study of characterizing migration behaviors.

4. ESTIMATION ON NORMALIZE CONSTANT USED IN RBM

Video Access Behavior. These works usually focus on one single system, and their analysis is also limited to a specific context. In contrast, our work collects a dataset of video viewing behaviors across six major video providers with contexts such as VoD, IPTV, live streaming. This allows us to understand user migratory patterns across content providers. [3] analyze the influence of video stream quality on user behavior from multiple CPs using quasi-experimental designs, but they do not have an in-depth study of characterizing migration behaviors.
